

A sequence of pictures to show children how to make a solar heater from a broken clay pot, cigarette foil and flour paste. This is one example of the series of posters on "Teaching Science with local Resources" at present being developed by the Curriculum Development Centre and the Janak Educational Material Corporation with the aid of a UNICEF consultant.

The poster was published in India as part of the SITE programme, but as photographs on that occasion. Since research by PSC has indicated that rural people in Nepal read drawings better than photos however, the posters are being produced in this new form for field trials at a Teachers' Workshop at Lahachok in November.
